Introducing the features of the new Silent Alert MK XI Universal Monitor

Audio Delays

The Universal Monitor MK XI has user defined audio delays to filter out background noise. When a sound is detected the monitor lights up orange. If the sound lasts longer than the pre-set delay the monitor will light up green and transmit.

Active Sound Display

The MK IV Pager has an active volume display when used with a MK XI Universal Monitor.

After the baby alarm signal is received the Pager will then display a real time visual indication of the sound level in the room using the Pagers illuminated keypad.

The user can then decide if the child needs attention or has gone back to sleep.
